

# Overview

## Arrays

Multiple values of common type.

Loop style handling.

# Motivating Arrays

```
final String
    karen = "Karen Smith",
    john = "John Duncan",
    paul = "Paul Jacobs",
    suzanne = "Suzanne Enders",
    peter = "Peter Phillips"; // 10 more to come ...

System.out.println(karen);
System.out.println(john);
...
```

# Per member repeating tasks

- Generate Comma separated list:

```
Karen Smith, John Duncan, Paul Jacobs, Suzanne Enders, Peter Phillips
```

- Generate HTML list emphasizing family names:

```
<ul>
  <li>Karen <emph>Smith</emph></li>
  <li>John <emph>Duncan</emph></li>
  <li>Paul <emph>Jacobs</emph></li>
  <li>Suzanne <emph>Enders</emph></li>
  <li>Peter <emph>Phillips</emph></li>
</ul>
```

## Example: int array of primes

```
final int[] primes ① = new int[5]; ②  
  
primes[0] = 2; ③  
primes[1] = 3;  
primes[2] = 5;  
primes[3] = 7;  
primes[4] = 11;
```

## Followup exercise

145. Assignment to final variable?

# Loop prime values

```
for (int i = 0; i < 5; i++) {  
    System.out.println("At index " + i + ": value == " + primes[i]);  
}
```

## Result:

```
At index 0: value == 2  
At index 1: value == 3  
At index 2: value == 5  
At index 3: value == 7  
At index 4: value == 11
```

# Mind the limit!

```
for (int i = 0; i < 6; i++) {  
    System.out.println("At index " + i + ": value == " + primes[i]);  
}
```

## Result:

```
At index 0: value == 2  
At index 1: value == 3  
At index 2: value == 5  
At index 3: value == 7  
At index 4: value == 11  
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 5  
at qq.arrayex.Motivate.main(Motivate.java:27)
```

# Safer: Using *length*

```
System.out.println("primes.length == " + primes.length);
for (int i = 0; i < primes.length; i++) {
    System.out.println("At index " + i + ": value == " + primes[i]);
}
```

---

Result:

```
primes.length == 5
At index 0: value == 2
At index 1: value == 3
At index 2: value == 5
At index 3: value == 7
At index 4: value == 11
```

# Even better: "for-each" style loop

```
for (final int p: primes) {  
    System.out.println("value == " + p);  
}
```

---

Result:

```
value == 2  
value == 3  
value == 5  
value == 7  
value == 11
```

# Mind the limit, part two

```
final int[] primes = new int[5]; // Last index is 4 rather than 5!  
  
primes[0] = 2;  
primes[1] = 3;  
primes[2] = 5;  
primes[3] = 7;  
primes[4] = 11;  
primes[5] = 13; // Excessing array limit
```

---

## Result:

---

```
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 5  
at qq.arrayex.Motivate.main(Motivate.java:25)
```

# Primitive data one step initialization

## Combining array allocation and value assignment:

```
final int[]  
primes = {2, 3, 5, 7, 11};
```

```
final int[] primes = new int[5];  
primes[0] = 2;  
primes[1] = 3;  
primes[2] = 5;  
primes[3] = 7;  
primes[4] = 11;
```

# Reference data one step initialization

## Combining array allocation and value assignment:

```
public class Rectangle {  
    private int width, height;  
    private boolean hasSolidBorder;  
    public Rectangle(int width, int height,  
                    boolean hasSolidBorder)  
        this.width = width;  
        this.height = height;  
        this.hasSolidBorder = hasSolidBorder  
    }  
}
```

```
final Rectangle[] rectList = new Rectangle[] {  
    new Rectangle(2, 5, true),  
    new Rectangle(4, 1, false)  
};
```

## Followup exercises

- 146. Converting string arrays to HTML.
- 147. Route navigation
- 148. Examinations and mark frequencies
- 149. Pangram checker

# Array

- Series of objects having identical type.
- Array consists of array elements.
- Element access by index value.
- Holding either primitive types or object references (Class instance or array).
- Contiguous storage in memory.
- Arbitrary array dimensions by virtue of nesting: One-dimensional, two-dimensional etc.

# Two syntax variants

1. 

```
type[] arrayName; // preferre
```
2. 

```
type arrayName[];
```

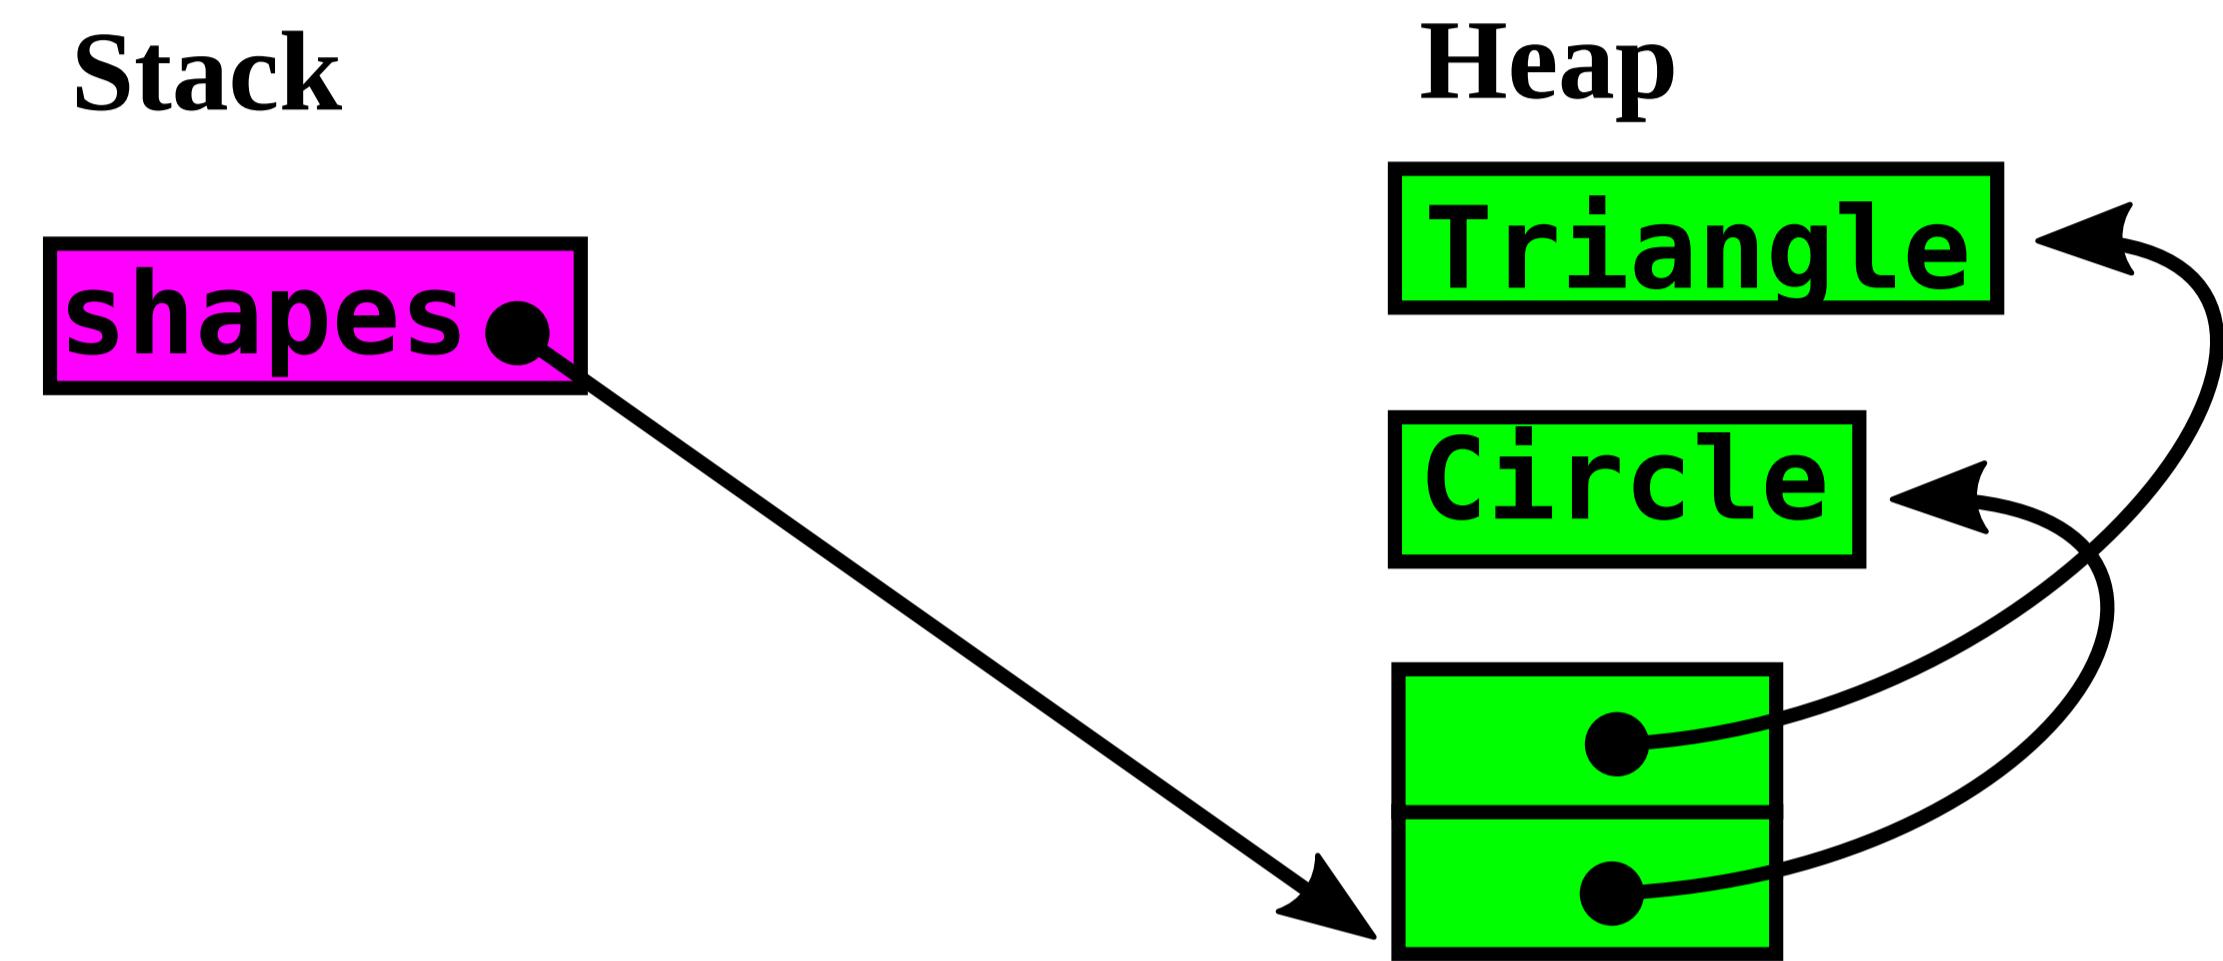

# Array instances are special!

```
...println("      String: " + "".getClass().getTypeName());
...println("      int[]: " + new int[]{}.getClass().getTypeName());
...println("      double[]: " + new double[]{}.getClass().getTypeName());
...println("      boolean[]: " + new boolean[]{}.getClass().getTypeName());
...println("StringBuffer[]: " + new StringBuffer[]{}.getClass().getTypeName());
```

```
String: java.lang.String
int[]: int[]
double[]: double[]
boolean[]: boolean[]
String[]: java.lang.String[]
StringBuffer[]: java.lang.StringBuffer[]
```

## Array creation details

```
final String[] shapes  
= new String[]{  
    new String("Triangle"),  
    new String("Circle")  
};
```

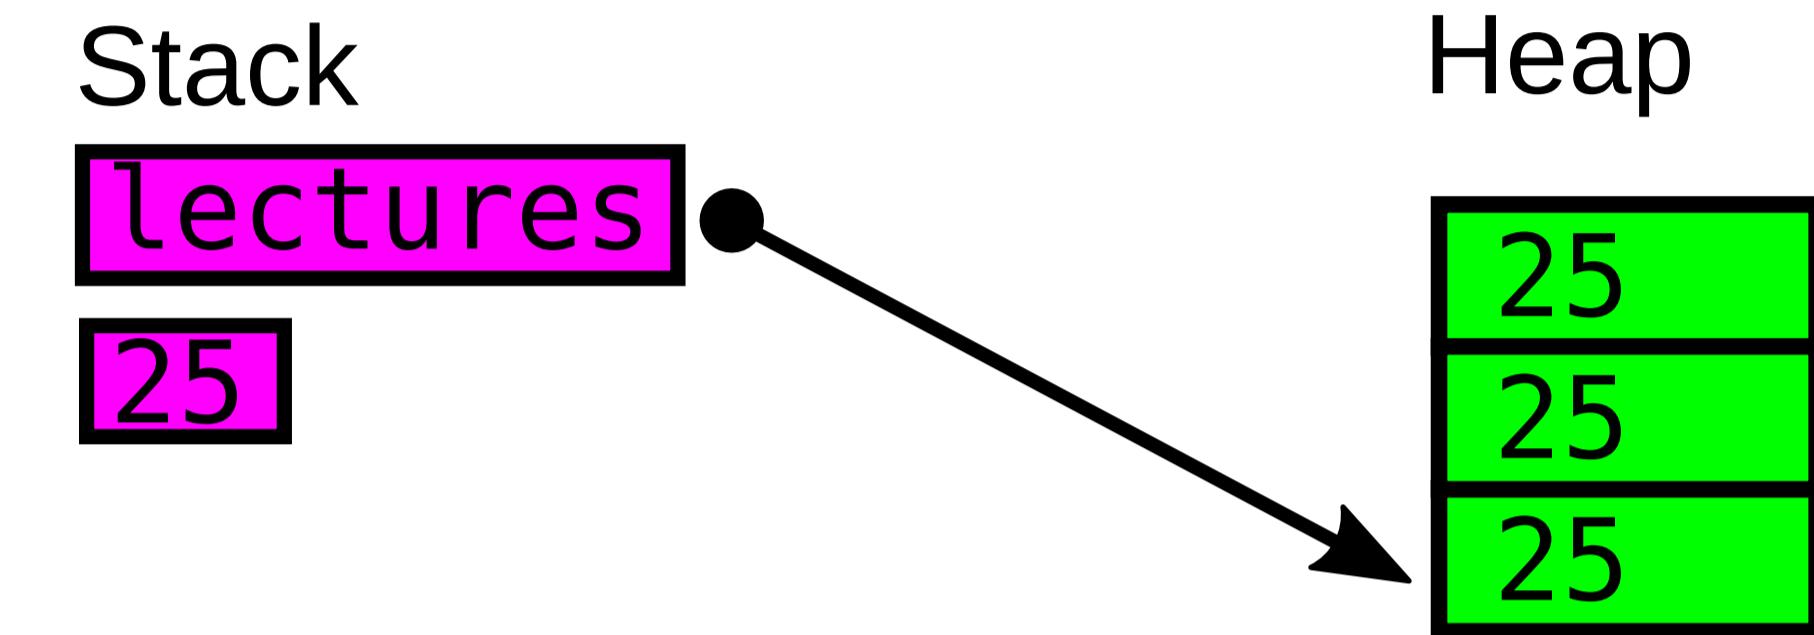

# Array parameter passing

```
public static void main(String[] args) {
    final int [] lectures = new int[3]; // Three lectures
    fill(lectures, 25); // Default lecture having 25 participants
    System.out.println("Second lecture has got " + lectures[1] +
        " participants");
}
/** 
 * Initialize array with default value.
 *
 * @param values Array to be initialized.
 * @param common New value for all array elements.
 */
static void fill(final int[] values, final int common) {
    for (int i = 0; i < values.length; i++) {
        values[i] = common;
    }
}
```

Second lecture has got 25 participants

## Parameter passing details

```
...main(...){  
    int [] lectures =  
        new int[3];  
    fill(lectures, 25);  
    ...println("Second ..." +  
        lectures[1] +  
        " participants");}  
  
..fill(final int[] values,  
final int common) {  
    for (int i = 0;  
        i < values.length; i++) {  
        values[i] = common;  
    }}
```

Print second array element.

# Value and reference types

```
// Value type  
final boolean values[] = new boolean[]{true, true, false, true};  
  
// Reference type  
final String shapes[] = new String[]{"Triangle", "Circle"};
```

Same result:

```
final boolean values[] = {true, true, false, true};  
final String shapes[] = {"Triangle", "Circle"};
```

Followup exercise

150. Reconsidering System.out.format().

## Arrays

→ `java.util.Arrays` helpers

Sorting and searching arrays.

Fill in values.

Compare array contents.

# Arrays.toString( . . . ) and Arrays.sort( . . . )

```
final String[] names = {"Eve", "Aaron", "Paul", "Mandy";  
System.out.println("    toString: " + Arrays.toString(names));  
Arrays.sort(names);  
System.out.println("sort|toString: " + Arrays.toString(names));
```

Result:

```
toString: [Eve, Aaron, Paul, Mandy]  
sort|toString: [Aaron, Eve, Mandy, Paul]
```

# Arrays.binarySearch(...)

```
final String[] names = {"Aaron", "Eve", "Mandy", "Paul"};  
// Precondition: Array must be ordered!  
...println("sort|find(Mand): " + Arrays.binarySearch(names, "Mand"));  
...println("sort|find(Mandy): " + Arrays.binarySearch(names, "Mandy"));  
...println("sort|find(Mandyer): " + Arrays.binarySearch(names, "Mandyer"));
```

## Result:

```
sort|find(Mand): -3  
sort|find(Mandy): 2  
sort|find(Mandyer): -4
```

Followup exercise

## 151. Understanding search results

# Arrays.fill( . . . )

```
final String[] names =  
{"Eve", "Aaron", "Paul", "Mandy"};  
  
System.out.println("toString: " +  
    Arrays.toString(names));  
  
Arrays.fill(names, "N.N");  
  
System.out.println("toString: " +  
    Arrays.toString(names));
```

```
toString: [Eve, Aaron, Paul, Mandy]  
toString: [N.N, N.N, N.N, N.N]
```

## Arrays.copyOfRange( . . . )

```
final String[] names = {"Eve", "Aaron", "Paul", "Mandy"};  
final String[] lastTwoNames = Arrays.copyOfRange(names, 2, 6);  
System.out.println("toString: " + Arrays.toString(lastTwoNames));
```

Result:

```
toString: [Paul, Mandy, null, null]
```

# Arrays.equals( . . . )

```
final String[]  
l1 = {new String("Eve"), new String("Aaron"),  
      new String("Paul"), new String("Mandy")},  
  
l2 = {new String("Eve"), new String("Aaron"),  
      new String("Paul"), new String("Mandy")},  
  
l3 = {new String("Eve"), new String("Aaron"),  
      new String("Paul"), new String("Mobile")};  
  
System.out.println("l1.equals(l2):" + Arrays.equals(l1, l2));  
System.out.println("l1.equals(l3):" + Arrays.equals(l1, l3));
```

Result:

```
l1.equals(l2):true  
l1.equals(l3):false
```

# Overview

## Arrays

→ Extending arrays

Dealing with fixed size.

# Lack of extendability

```
final String[] member = {"Eve", "John", "Peter", "Jill"};
final String newCourseMember = "Ernest";
member.length = 5; // Error: Size unchangeable
member[4] = newCourseMember;
```

# Extending an array

```
public static void main(String[] args) {  
    ① String[] member = {"Eve", "John", "Peter", "Jill"};  
    final String newMember = "Ernest";  
    member ②= append(member, newMember);  
}  
static String[] append (final String[] values, final String newValue) {  
    final String[] copy = ③ new String[values.length + 1];  
    for (int i = 0; i < values.length; i++) { ④  
        copy[i] = values[i]; ⑤  
    }  
    copy[copy.length - 1] = newValue; ⑥  
    return copy;  
}
```

# Extension result

```
final String[] member = {"Eve", "John", "Peter", "Jill"};
System.out.println("Original array: " + Arrays.toString(member));
final String newMember = "Ernest";
member = append(member, newMember);
System.out.println("Extended array: " + Arrays.toString(member));
```

```
Original array: [Eve, John, Peter, Jill]
Extended array: [Eve, John, Peter, Jill, Ernest]
```

# Using `Arrays.copyOf()`

```
public static void main(String[] args) {  
    final int [] start = {1,7,-4},  
    added = append(start, 77);  
    System.out.println("added: " + Arrays.toString(added));  
}  
static public int[] append(final int[] values, final int newValue) {  
    final int[] result = Arrays.copyOf(values, values.length + 1);  
    result[values.length] = newValue;  
    return result;}
```

Result:

```
added: [1, 7, -4, 77]
```

## Followup exercises

152. [Implementing append directly](#)
153. [Purge duplicates](#)
154. [A container of fixed capacity holding integer values](#)
155. [Allow for variable capacity holding integer values](#)

## Arrays

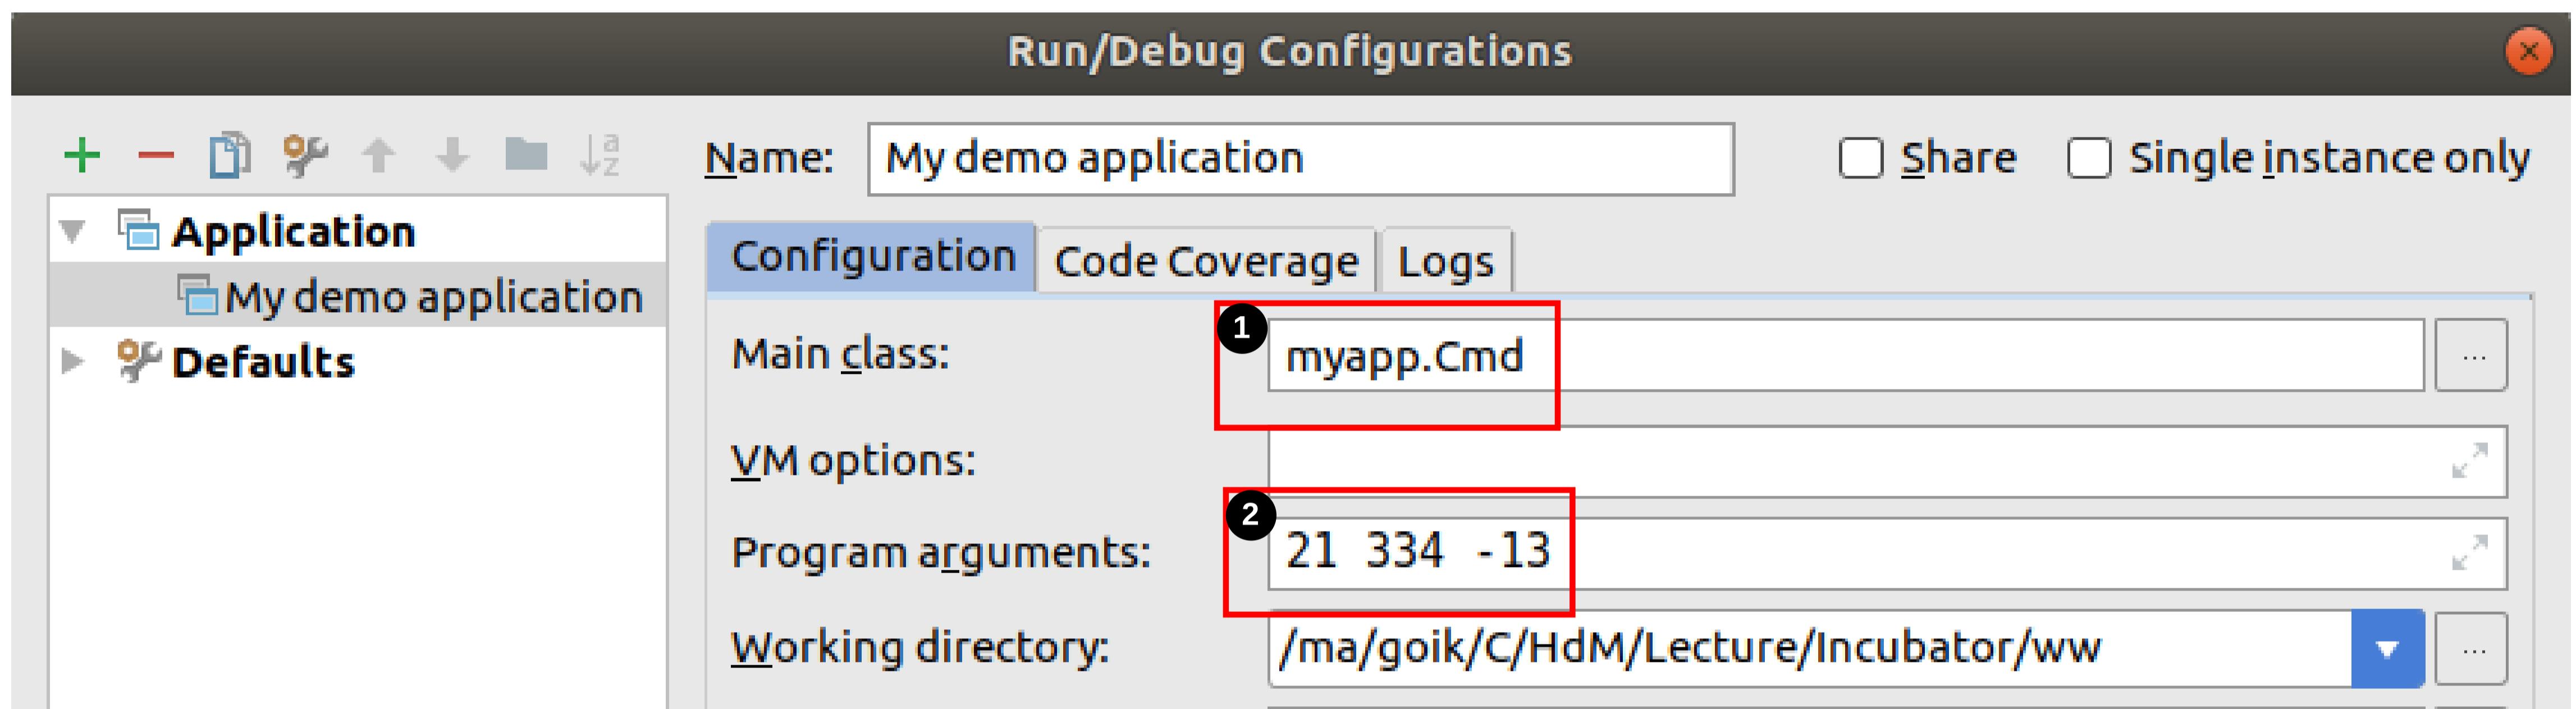

- Understanding static public int main(String[] args) main(...) and its array argument.
- Implementing parameter passing.

```
public static void main(String[] args)
```

```
package myapp;
public class Cmd {
    public static void main(String[] args) {
        for (int i = 0; i < args.length; i++) {
            System.out.println("Parameter " + (i + 1) + ": " + args[i]);
        }
    }
}
```

```
java myapp.Cmd 21 334 -13
Parameter 1: 21
Parameter 2: 334
Parameter 3: -13
```

# IntelliJ IDEA run configuration

- ① Entry class `myapp.Cmd` containing ... `main(String[] args)`.
- ② Parameters 21, 334 and -13 being passed to `String[] args`.

# IntelliJ IDEA run configuration

The screenshot shows the IntelliJ IDEA interface with the following details:

- File Bar:** File, Edit, View, Navigate, Code, Analyze, Refactor, Build, Run, Tools, VCS, Window, Help.
- Project Structure:** Shows the file tree: `ww > src > main > java > myapp > Cmd`. The `Cmd.java` file is selected.
- Toolbars:** Includes icons for Command Line (Cmd), Run, Stop, Refresh, and Search.
- Code Editor:** Displays the `Cmd.java` code:

```
1 package myapp;
2 public class Cmd {
3     public static void main(String[] args) {
4         for (int i = 0; i < args.length; i++) {
5             System.out.println("Parameter " + (i + 1) + ": " + args[i]);
6         }
7     }
8 }
```

A yellow selection bar highlights the closing brace of the `main` method.
- Run/Debug Toolbar:** Shows the current configuration: `Cmd`.
- Output Window:** Shows the command line output:

```
/usr/lib/jvm/java-8-oracle/bin/java ...
Parameter 1: 21
Parameter 2: 334
Parameter 3: -13
```

The message `Process finished with exit code 0` is at the bottom.

# Creating executable jar

```
<artifactId>maven-shade-plugin</artifactId>
...
<transformer ...>
  <manifestEntries>
    <Main-Class>myapp.Cmd</Main-Class>
  </manifestEntries>...
```

```
unzip ww-1.0-SNAPSHOT.jar
cat tmp/META-INF/MANIFEST.MF
...
Created-By: Apache Maven 3.5.0
Build-Jdk: 1.8.0_151
Main-Class: myapp.Cmd
```

```
mvn package ...
java -jar target/ww-1.0-SNAPSHOT.jar 21 334 -13
Parameter 1: 21
Parameter 2: 334
Parameter 3: -13
```

# Followup exercises

- 156. Reading console input
- 157. Prettifying output representation

## Arrays

→ Multi-dimensional arrays

Multiple dimensions by nesting of arrays.

# Two-dimensional arrays

```
final int[][] matrix = new int[2][3];

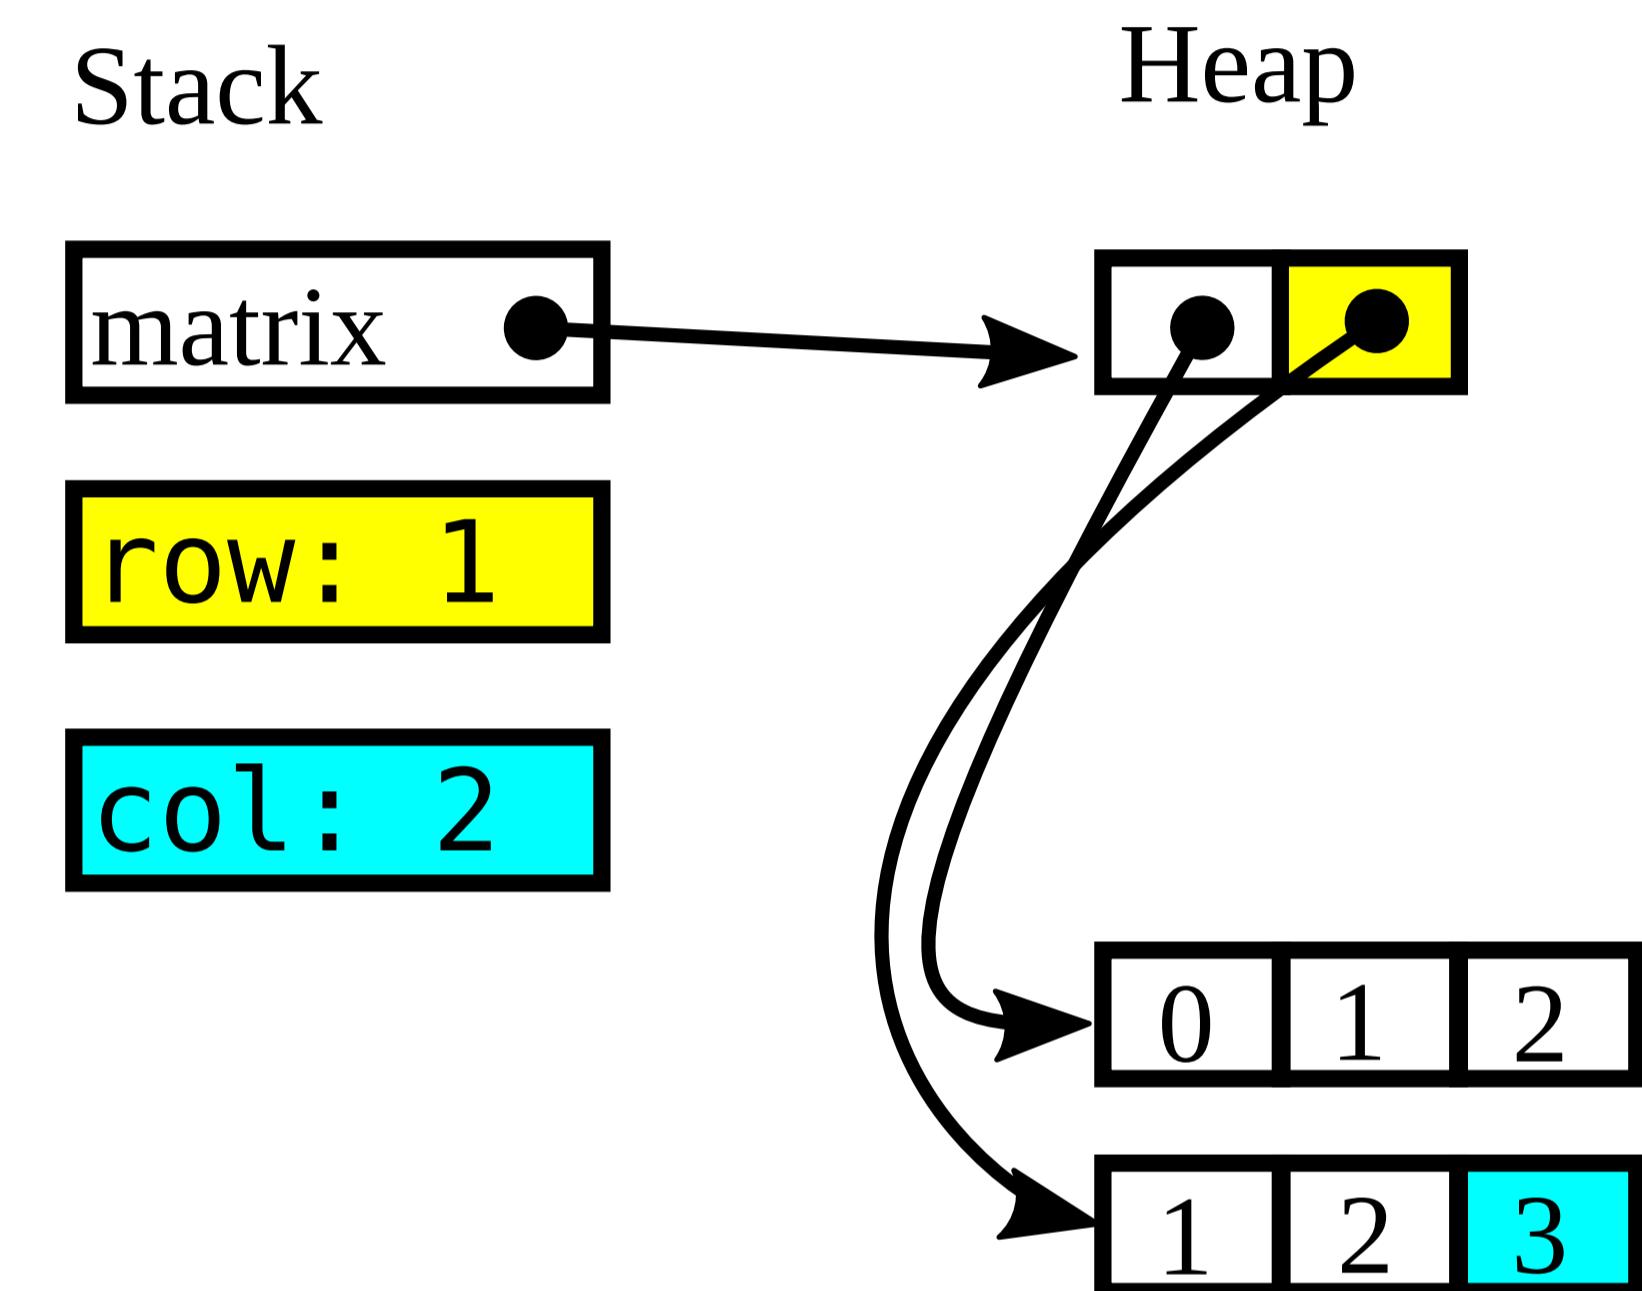

for (int row = 0; row < 2; row++) {
    for (int col = 0; col < 3; col++) {
        matrix[row][col] = col + row;
    }
}
for (int row = 0; row < 2; row++) {
    System.out.println(Arrays.toString(matrix[row]));
}
```

# Behind the scenes

```
final int[][] matrix = new int[2][]; // Array containing two int arrays
matrix[0] = new int[3];           // first int array
matrix[1] = new int[3];           // second int array
```

# Memory allocation

```
int[][] matrix = new int[2][];
matrix[0] = new int[3];
matrix[1] = new int[3];
for (int row = 0; row < 2; row++){
    for (int col = 0; col < 3; col++){
        matrix[row][col] = col + row;
    }
}
```

Followup exercise

## 158. 2-dimensional arrays and `.length`

# Static array initialization

```
final int[][] matrix = new int[][] {  
    {0, 1, 2},  
    {1, 2, 3}  
};
```

# Static array initialization, variable lengths

```
final String[][] groups = new String[][] {  
    {"Jill", "Tom"},  
    {"Jane", "Smith", "Joe"},  
    {"Jeff"}  
};  
  
for (int row = 0; row < groups.length; row++) {  
    System.out.println(Arrays.toString(groups[row]));  
}
```

```
[Jill, Tom]  
[Jane, Smith, Joe]  
[Jeff]
```

## Followup exercises

159. External array and string exercises
160. Tic-tac-toe using a two-dimensional array
161. Changing the game's internal representation
162. Tic-tac-toe, Computer vs. human
163. Adding support to retrieve statistical data.
164. Testing an implementation
165. Improving prime number calculation performance
166. Calculating the median
167. A simple character based plotting application
